

The ICCSimTMat for Fiserv combines powerful functionality with an intuitive user experience, enabling organisations to execute test campaigns quickly, efficiently, and cost-effectively. As a fully self-contained solution, it eliminates the need for additional components while delivering comprehensive testing capabilities.

Unlike traditional testing environments, ICCSimTMat for Fiserv removes the dependency on complex hardware configurations, restrictive card adaptors, separate spy tools, and extensive card decks. Everything needed to perform testing is available within a single, integrated platform.

Seamless integration with the Fiserv portal provides users with direct access to projects and enables convenient upload of test logs throughout the testing lifecycle, whether during execution or after completion. This ensures a more streamlined, efficient, and connected certification process.

Includes:

- Software required for testing all the major payment brands.
- All test cards required to run the tests
- Card reader / writer unit
- First year support & maintenance- including Helpdesk access

Optional: a card probe (PaytestProbe) can be used instead of the cards (excluding fallback tests). Contact us for more information.

The Fiserv Test Kit is now **online licensed**, removing the need for USB keys and giving greater flexibility for customers.

Fully approved EMV
